Thm.  $f, g$  在  $(x_0, x_0 + \rho)$  中可导,  $g'(x) \neq 0$ ,  $\lim_{x \rightarrow x_0^+} \frac{f'(x)}{g'(x)} = A$ , 则

(1) (0/0型)  $\lim_{x \rightarrow x_0^+} f(x) = \lim_{x \rightarrow x_0^+} g(x) = 0 \Rightarrow \lim_{x \rightarrow x_0^+} \frac{f(x)}{g(x)} = A.$

(2) ( $\infty/\infty$ 型)  $\lim_{x \rightarrow x_0^+} g(x) = \infty \Rightarrow \lim_{x \rightarrow x_0^+} \frac{f(x)}{g(x)} = A.$

Thm.  $f, g$  在  $(a, +\infty)$  中可导,  $g'(x) \neq 0, \lim_{x \rightarrow +\infty} \frac{f'(x)}{g'(x)} = A$ , 则

(1) (0/0型)  $\lim_{x \rightarrow +\infty} f(x) = \lim_{x \rightarrow +\infty} g(x) = 0 \Rightarrow \lim_{x \rightarrow +\infty} \frac{f(x)}{g(x)} = A.$

(2) ( $\infty/\infty$ 型)  $\lim_{x \rightarrow +\infty} g(x) = \infty \Rightarrow \lim_{x \rightarrow +\infty} \frac{f(x)}{g(x)} = A.$

- 运用L'Hospital法则时注意适时分离与等价因子替换.

## § 3.Taylor公式

$f$ 在 $x_0$ 可导,则有

$$f(x) = f(x_0) + f'(x_0)(x - x_0) + o(x - x_0), \quad (x \rightarrow x_0)$$

**Question.**  $f$ 在 $x_0$ 处 $n$ 阶可导,是否有更高精度的近似?是否有 $n$ 次多项式近似?

Question. 当 $x \rightarrow x_0$ 时,

$$f(x) \approx P_n(x) = a_0 + a_1(x - x_0) + \cdots + a_n(x - x_0)^n,$$

系数 $a_0, a_1, \dots, a_n$ 应满足什么条件? 若要求

$$f(x_0) = P_n(x_0), f'(x_0) = P'_n(x_0), \dots, f^{(n)}(x_0) = P_n^{(n)}(x_0),$$

则有

$$a_0 = f(x_0), f'(x_0) = a_1, \dots, f^{(n)}(x_0) = n!a_n.$$

Def.  $f$  在  $x_0$  处有  $n$  阶导数, 称

$$P_n(x) = f(x_0) + f'(x_0)(x - x_0) + \cdots + \frac{1}{n!} f^{(n)}(x_0)(x - x_0)^n$$

为  $f$  在  $x_0$  处的  $n$  阶 Taylor 多项式.

## Thm.(带Peano余项的Taylor公式)

$f$ 在 $x_0$ 处有 $n$ 阶导数, 则当 $x \rightarrow x_0$ 时,

$$f(x) = \sum_{k=0}^n \frac{1}{k!} f^{(k)}(x_0)(x-x_0)^k + o\left((x-x_0)^n\right).$$

$x_0 = 0$ 时, 称之为Maclaurin公式.

Proof.  $f$ 在 $x_0$ 处有 $n$ 阶导数, 则 $f$ 在 $x_0$ 的邻域中 **$n-1$** 阶可导.

令

$$R_n(x) = f(x) - \sum_{k=0}^n \frac{1}{k!} f^{(k)}(x_0)(x-x_0)^k,$$

则 $R_n^{(k)}(x)$ 在 $x_0$ 的邻域中可导,  $k = 0, 1, 2, \dots, n-1$ , 且

$$R_n(x_0) = R'_n(x_0) = R''_n(x_0) = \cdots = R_n^{(n)}(x_0) = 0.$$

$$\lim_{x \rightarrow x_0} R_n(x) = \lim_{x \rightarrow x_0} R'_n(x) = \cdots = \lim_{x \rightarrow x_0} R_n^{(\textcolor{red}{n-1})}(x) = 0.$$

应用 $n-1$ 次L'Hospital法则,得

$$\begin{aligned} \lim_{x \rightarrow x_0} \frac{R_n(x)}{(x - x_0)^n} &= \lim_{x \rightarrow x_0} \frac{R'_n(x)}{n(x - x_0)^{n-1}} = \cdots = \lim_{x \rightarrow x_0} \frac{R_n^{(n-1)}(x)}{n!(x - x_0)} \\ &= \lim_{x \rightarrow x_0} \frac{R_n^{(n-1)}(x) - R_n^{(n-1)}(x_0)}{n!(x - x_0)} = \frac{R_n^{(n)}(x_0)}{n!} = 0. \square \end{aligned}$$

Question. 以上证明中为什么只能用 $n-1$ 次L'Hospital法则?

Thm.(带Lagrange余项的Taylor公式)  $f$  在  $(a, b)$  上  $n+1$  阶可导,  $f^{(n)} \in C[a, b]$ ,  $x_0, x \in [a, b]$ , 则存在介于  $x_0$  与  $x$  之间的  $\xi$ , s.t.

$$f(x) = \sum_{k=0}^n \frac{1}{k!} f^{(k)}(x_0)(x - x_0)^k + \frac{f^{(n+1)}(\xi)}{(n+1)!} (x - x_0)^{n+1}.$$

Proof. 令  $R_n(x) = f(x) - \sum_{k=0}^n \frac{1}{k!} f^{(k)}(x_0)(x - x_0)^k$ , 则  $R_n(x_0) =$

$R'_n(x_0) = R''_n(x_0) = \cdots = R_n^{(n)}(x_0) = 0$ . 由 Cauchy 中值定理,

$$\begin{aligned} \frac{R_n(x)}{(x - x_0)^{n+1}} &= \frac{R_n(x) - R_n(x_0)}{(x - x_0)^{n+1} - (x_0 - x_0)^{n+1}} = \frac{R'_n(\xi_1)}{(n+1)(\xi_1 - x_0)^n} \\ &= \cdots = \frac{R_n^{(n+1)}(\xi_{n+1})}{(n+1)!} = \frac{f^{(n+1)}(\xi_{n+1})}{(n+1)!}. \quad \square \end{aligned}$$

Thm.(Taylor多项式的唯一性)  $f$  在  $x_0$  处有  $n$  阶导数, 存在  $n$  次多项式  $Q_n(x)$ , s.t.

$$f(x) = Q_n(x) + o\left((x - x_0)^n\right) \quad (x \rightarrow x_0),$$

则  $Q_n(x) = P_n(x) = \sum_{k=0}^n \frac{1}{k!} f^{(k)}(x_0)(x - x_0)^k$ .

Proof. 由带Peano余项的Taylor公式,

$$f(x) = P_n(x) + o\left((x - x_0)^n\right) \quad (x \rightarrow x_0).$$

因而  $Q_n(x) - P_n(x) = o\left((x - x_0)^n\right)$ .

记  $Q_n(x) - P_n(x) = b_0 + b_1(x - x_0) + \cdots + b_n(x - x_0)^n$ , 则

$$b_0 + b_1(x - x_0) + \cdots + b_n(x - x_0)^n = o\left((x - x_0)^n\right) \quad (x \rightarrow x_0).$$

令  $x \rightarrow x_0$ , 得  $b_0 = 0$ ,

$$b_1(x - x_0) + \cdots + b_n(x - x_0)^n = o\left((x - x_0)^n\right) \quad (x \rightarrow x_0),$$

$$b_1 + b_2(x - x_0) + \cdots + b_n(x - x_0)^{n-1} = o\left((x - x_0)^{n-1}\right) \quad (x \rightarrow x_0).$$

令  $x \rightarrow x_0$ , 得  $b_1 = 0$ ,

$$b_2(x - x_0) + \cdots + b_n(x - x_0)^{n-1} = o\left((x - x_0)^{n-1}\right) \quad (x \rightarrow x_0).$$

依次类推, 得

$$b_0 = b_1 = \cdots = b_n = 0,$$

$$Q_n(x) - P_n(x) = 0. \square$$

Ex.  $e^x = 1 + x + \frac{x^2}{2!} + \cdots + \frac{x^n}{n!} + o(x^n), \quad x \rightarrow 0.$

$$e^x = 1 + x + \frac{x^2}{2!} + \cdots + \frac{x^n}{n!} + \frac{e^\xi}{(n+1)!} x^{n+1}, \quad \xi \text{介于 } 0, x \text{ 之间.}$$

Ex.  $\sin x = x - \frac{x^3}{3!} + \cdots + (-1)^{n-1} \frac{x^{2n-1}}{(2n-1)!} + o(x^{2n}), \quad x \rightarrow 0.$  (2n阶)

$$\sin x = x - \frac{x^3}{3!} + \cdots + (-1)^{n-1} \frac{x^{2n-1}}{(2n-1)!} + o(x^{2n-1}), \quad x \rightarrow 0.$$
 (2n-1阶)

$$= x - \frac{x^3}{3!} + \cdots + (-1)^{n-1} \frac{x^{2n-1}}{(2n-1)!} + \frac{\sin(\xi + \frac{2n+1}{2}\pi)}{(2n-1)!} x^{2n+1}, \quad x \rightarrow 0.$$

---

Ex.  $\cos x = 1 - \frac{x^2}{2!} + \cdots + (-1)^n \frac{x^{2n}}{(2n)!} + o(x^{2n}), \quad x \rightarrow 0.$

$$\cos x = 1 - \frac{x^2}{2!} + \cdots + (-1)^n \frac{x^{2n}}{(2n)!} + o(x^{2n+1}), \quad x \rightarrow 0.$$

Ex.  $\ln(1+x) = x - \frac{x^2}{2} + \cdots + (-1)^{n-1} \frac{x^n}{n} + o(x^n), \quad x \rightarrow 0.$

Ex.  $(1+x)^\alpha = 1 + \alpha x + \frac{\alpha(\alpha-1)}{2} x^2 + \cdots$   
           $+ \frac{\alpha(\alpha-1)\cdots(\alpha-n+1)}{n!} x^n + o(x^n), \quad x \rightarrow 0.$

---

Ex.  $\frac{1}{1+x} = 1 - x + x^2 + \cdots + (-1)^n x^n + o(x^n), \quad x \rightarrow 0.$

Ex.  $\frac{1}{1-x} = 1 + x + x^2 + \cdots + x^n + o(x^n), \quad x \rightarrow 0.$

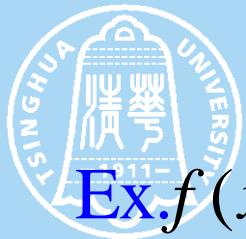

Ex.  $\frac{1}{2x-x^2}$  在  $x_0=1$  处带Peano余项的Taylor公式及  $f^{(100)}(1)$ .

解:  $f(x) = \frac{1}{1-(x-1)^2}$

$$= 1 + (x-1)^2 + (x-1)^4 + \cdots + (x-1)^{2n} + o((x-1)^{2n}), \quad x \rightarrow 1.$$

$$f^{(100)}(1) = 100!.$$

Remark. 间接展开法求Taylor公式.

Ex.  $f(x) = e^{\sin^2 x}$ ,  $x_0 = 0$ , 4阶Peano.

$$\sin x = x - \frac{1}{6}x^3 + \cdots + (-1)^{n-1} \frac{x^{2n-1}}{(2n-1)!} + o(x^{2n}) \quad (x \rightarrow 0),$$

$$e^t = 1 + t + \frac{t^2}{2!} + \cdots + \frac{t^n}{n!} + o(t^n) \quad (t \rightarrow 0).$$

$$\begin{aligned} e^{\sin^2 x} &= 1 + \sin^2 x + \frac{\sin^4 x}{2!} + o(\sin^4 x) \\ &= 1 + \left( x - \frac{1}{6}x^3 + o(x^3) \right)^2 + \frac{1}{2!}(x + o(x))^4 + o(x^4) \\ &= 1 + x^2 - \frac{1}{3}x^4 + o(x^4) + \frac{1}{2}x^4 + o(x^4) \\ &= 1 + x^2 + \frac{1}{6}x^4 + o(x^4) \quad (x \rightarrow 0). \square \end{aligned}$$

Ex.  $\lim_{x \rightarrow 0^+} \frac{e^{\sin^2 x} - \cos 2\sqrt{x} - 2x}{x^2}$

Question. 展开到哪一阶?

解:  $\cos 2\sqrt{x} = 1 - \frac{4x}{2!} + \frac{16x^2}{4!} + o(x^2) \quad (x \rightarrow 0)$

$$e^{\sin^2 x} = 1 + \sin^2 x + o(\sin^2 x) \quad (x \rightarrow 0)$$

$$= 1 + (x + o(x))^2 + o(x^2) \quad (x \rightarrow 0)$$

$$= 1 + x^2 + o(x^2) \quad (x \rightarrow 0)$$

$$\text{原式} = \lim_{x \rightarrow 0^+} \frac{1 + x^2 - (1 - 2x + \frac{2}{3}x^2) - 2x + o(x^2)}{x^2} = \frac{1}{3}. \square$$

Ex.  $\lim_{x \rightarrow 0} \frac{e^{ax^k} - \cos x^2}{x^8}$  存在, 求  $a, k$  及极限值.

解:  $x \rightarrow 0$  时,  $\cos x^2 = 1 - \frac{x^4}{2!} + \frac{x^8}{4!} + o(x^8)$ ,

$$e^{ax^k} = 1 + ax^k + \frac{1}{2!} a^2 x^{2k} + o(x^{2k}).$$

$$e^{ax^k} - \cos x^2 = ax^k + \frac{x^4}{2!} + \frac{1}{2!} a^2 x^{2k} - \frac{x^8}{4!} + o(x^8) + o(x^{2k})$$

原极限存在, 则  $ax^k + \frac{x^4}{2!} = 0, k = 4, a = -\frac{1}{2}$ ,

$$\text{原极限} = \lim_{x \rightarrow 0} \frac{\frac{1}{8} x^8 - \frac{1}{4!} x^8 + o(x^8)}{x^8} = \frac{1}{12}. \square$$

---

Ex.  $\lim_{x \rightarrow 0} \left( \frac{1}{\sin^2 x} - \frac{1}{x^2} \right)$

$$= \lim_{x \rightarrow 0} \frac{x^2 - \sin^2 x}{x^2 \sin^2 x} = \lim_{x \rightarrow 0} \frac{x^2 - \left( x - \frac{1}{6}x^3 + o(x^3) \right)^2}{x^2 \sin^2 x}$$

$$= \lim_{x \rightarrow 0} \frac{x^2 - \left( x^2 - \frac{1}{3}x^4 + o(x^4) \right)}{x^2 \sin^2 x}$$

$$= \lim_{x \rightarrow 0} \frac{\frac{1}{3}x^4 + o(x^4)}{x^2 \sin^2 x} = \frac{1}{3}. \square$$

---

Ex.  $\lim_{x \rightarrow \infty} (1 + 1/x)^{x^2} e^{-x}$

$$= \lim_{x \rightarrow \infty} \exp \left\{ x^2 \ln(1 + 1/x) - x \right\}$$

$$= \lim_{x \rightarrow \infty} \exp \left\{ x^2 \left( \frac{1}{x} - \frac{1}{2x^2} + o(\frac{1}{2x^2}) \right) - x \right\}$$

$$= \lim_{x \rightarrow \infty} \exp \left\{ -\frac{1}{2} + o(1) \right\}$$

$$= e^{-1/2}.$$

**Ex.**  $f$  在  $[-1, 1]$  上三阶可导,  $f(1) = 1, f(-1) = 0, f'(0) = 0$ , 则  
 $\exists \xi \in (-1, 1), s.t. f'''(\xi) = 3$ .

**Proof.**  $\exists \xi_1 \in (0, 1), \xi_2 \in (-1, 0), s.t.$

$$1 = f(1) = f(0) + f'(0) + \frac{1}{2!} f''(0) + \frac{1}{3!} f'''(\xi_1)$$

$$0 = f(-1) = f(0) - f'(0) + \frac{1}{2!} f''(0) - \frac{1}{3!} f'''(\xi_2)$$

两式相减, 由  $f'(0) = 0$  得

$$3 = \frac{1}{2} (f'''(\xi_1) + f'''(\xi_2)).$$

由 Darboux 定理,  $\exists \xi \in (\xi_2, \xi_1) \subset (-1, 1), s.t. f'''(\xi) = 3$ .  $\square$

Ex. (1)  $\forall x \in \mathbb{R}, |f(x)| \leq M_0, |f''(x)| \leq M_2$ , 则  $|f'(x)| \leq \sqrt{2M_0 M_2}$ .

(2)  $\forall c \in (0,1), |f(c)| \leq M_0, |f''(c)| \leq M_2$ , 则  $|f'(c)| \leq 2M_0 + \frac{1}{2}M_2$ .

Proof. (1)  $\forall x \in \mathbb{R}, \forall h > 0$ ,

$$f(x+h) = f(x) + f'(x)h + \frac{f''(\xi_1)}{2}h^2,$$

$$f(x-h) = f(x) - f'(x)h + \frac{f''(\xi_2)}{2}h^2.$$

两式相减, 得

$$2f'(x)h = f(x+h) - f(x-h) + \frac{h^2}{2}(f''(\xi_2) - f''(\xi_1))$$

$$\begin{aligned}|f'(x)| &\leq \frac{|f(x+h)-f(x-h)|}{2h} + \frac{h}{4} |f''(\xi_2)-f''(\xi_1)| \\&\leq \frac{M_0}{h} + \frac{h}{2} M_2, \quad \forall x \in \mathbb{R}, \forall h > 0.\end{aligned}$$

令  $h = \sqrt{2M_0/M_2}$ , 得

$$|f'(x)| \leq \sqrt{2M_0 M_2}, \quad \forall x \in \mathbb{R}.$$

(2)  $\forall \delta \in (0, \frac{1}{2})$ , 有

$$f(1-\delta) = f(c) + f'(c)(1-\delta-c) + \frac{f''(\xi_1)}{2}(1-\delta-c)^2,$$

$$f(\delta) = f(c) + f'(c) \cdot (\delta - c) + \frac{f''(\xi_2)}{2} \cdot (\delta - c)^2,$$

两式相减, 得

$$(1-2\delta)f'(c) = f(1-\delta) - f(\delta) - \frac{1}{2} \left( f''(\xi_1)(1-\delta-c)^2 - f''(\xi_2)(\delta-c)^2 \right),$$

$$\begin{aligned}|f'(c)| &\leq \frac{1}{1-2\delta} |f(1-\delta) - f(\delta)| \\&\quad + \frac{1}{2(1-2\delta)} \left( |f''(\xi_1)|(1-\delta-c)^2 + |f''(\xi_2)|(\delta-c)^2 \right)\end{aligned}$$

$$\leq \frac{2M_0}{1-2\delta} + \frac{M_2}{2(1-2\delta)} \left( (1-\delta-c)^2 + (\delta-c)^2 \right)$$

令  $\delta \rightarrow 0^+$ , 得

$$|f'(c)| \leq 2M_0 + \frac{M_2}{2} \left( (1-c)^2 + c^2 \right) \leq 2M_0 + \frac{M_2}{2}, \forall c \in (0,1). \square$$

Ex.  $xy - e^x + e^y = 0$  确定了隐函数  $y = y(x)$ , 求  $y(x)$  在  $x_0 = 0$  处的2阶Maclaurin展开式.

解:  $y(x) = y(0) + y'(0)x + \frac{y''(0)}{2!}x^2 + o(x^2).$

由  $xy - e^x + e^y = 0$  得  $y(0) = 0.$

求导得  $y + xy' - e^x + e^y \cdot y' = 0, y'(0) = 1.$

再求导得

$$2y' + xy'' - e^x + e^y \cdot (y')^2 + e^y \cdot y'' = 0, y''(0) = -2.$$

故  $y(x) = x - x^2 + o(x^2)$ .  $\square$

Ex.  $f(x) = f(0) + f'(0)x + \frac{1}{2}f''(\theta(x)x)x^2$ ,  $\theta(x) \in (0, 1)$ .

若  $f'''(0) \neq 0$ , 则  $\lim_{x \rightarrow 0} \theta(x) = 1/3$ .

Proof.  $f(x) = f(0) + f'(0)x + \frac{1}{2}f''(\theta(x)x)x^2$ ,

$$f(x) = f(0) + f'(0)x + \frac{1}{2}f''(0)x^2 + \frac{1}{3!}f'''(0)x^3 + o(x^3).$$

于是,

$$\lim_{x \rightarrow 0} \frac{f''(\theta(x)x) - f''(0)}{x} = \lim_{x \rightarrow 0} \left( \frac{f'''(0)}{3} + o(1) \right) = \frac{f'''(0)}{3}.$$

而  $\lim_{x \rightarrow 0} \frac{f''(\theta(x)x) - f''(0)}{\theta(x)x} = f'''(0) \neq 0$ , 故  $\lim_{x \rightarrow 0} \theta(x) = \frac{1}{3}$ .  $\square$

Ex. 证明 $e$ 是无理数.

Proof. 反设 $e = \frac{m}{n}, m, n > 0$ , 互质.

$$e^t = 1 + t + \frac{t^2}{2!} + \cdots + \frac{t^n}{n!} + \frac{e^{\theta t} t^{n+1}}{(n+1)!}, \quad 0 < \theta < 1.$$

令 $t = 1$ , 得  $e = 2 + \frac{1}{2!} + \cdots + \frac{1}{n!} + \frac{e^\theta}{(n+1)!} > 2, \quad 0 < \theta < 1.$

于是,  $\frac{e^\theta}{n+1} = n! \left( e - 2 + \frac{1}{2!} + \cdots + \frac{1}{n!} \right)$  为正整数.

而 $\theta \in (0, 1), e^\theta \in (1, e)$ , 所以 $n+1 = 2, n = 1, e = m \in \mathbb{Z}$ ,

与 $e = \lim_{k \rightarrow \infty} (1 + \frac{1}{k})^k \in (2, 3)$  矛盾.  $\square$
